Employee Laptop Request Management System

Ideation Phase

Project Name	Employee Laptop Request Management System
Project Type	Individual Project
Document Date	12 September 2026
Platform	ServiceNow

1. Project Background

The Employee Laptop Request Management System is an individual ServiceNow project intended to replace informal email- and verbally-driven laptop requests with a centralized, traceable workflow. It captures employee and request information, checks the annual duplicate-request policy, routes requests to the responsible manager and communicates the decision.

2. Brainstorming and Idea Grouping

Idea group	Ideas considered	Purpose
Request submission	Centralized Record Producer; capture requester and request details	Standardize the employee entry point.
Request classification	Basic / Advance request type; Software Development / Personal Use / Other reason	Capture the need and justification.
Validation and policy	Required information; one request per employee per calendar year	Improve data quality and prevent duplicates.
Approval and accountability	Manager reference; approval / rejection handling	Ensure decisions are traceable.
Status and tracking	Pending Approval, Approved and Rejected states	Make request progress visible.
Automation and communication	Flow Designer; approval and outcome notifications	Reduce manual follow-up.
Security and access	it_employee and it_manager roles with ACLs	Restrict access by responsibility.

3. Idea Prioritization

Priority	Idea	Impact	Effort	Decision
1	Centralized Record Producer	High	Medium	Must have
2	Annual duplicate prevention	High	Medium	Must have
3	Manager approval workflow	High	Medium	Must have
4	Request status tracking	High	Low	Must have
5	Email notifications	High	Medium	Must have
6	Role-based access	High	Medium	Must have
7	Request classification	High	Low	Must have
8	Validation and error handling	High	Medium	Must have
9	Update-set deployment validation	High	Medium	Must have

4. Problem Statements

ID	User	I am trying to…	But…	Because…	Impact
PS-1	Employee	Submit a laptop request with complete details	Manual emails and verbal requests can be incomplete or difficult to track	There is no centralized controlled process	Delays, duplicate requests and unclear status
PS-2	IT Manager	Review requests and make accountable decisions	Request details and approval status may not be consistently tracked	Manual handling reduces visibility	Incorrect approvals, repeated follow-up and poor traceability

5. Empathy Map – Employee Requester

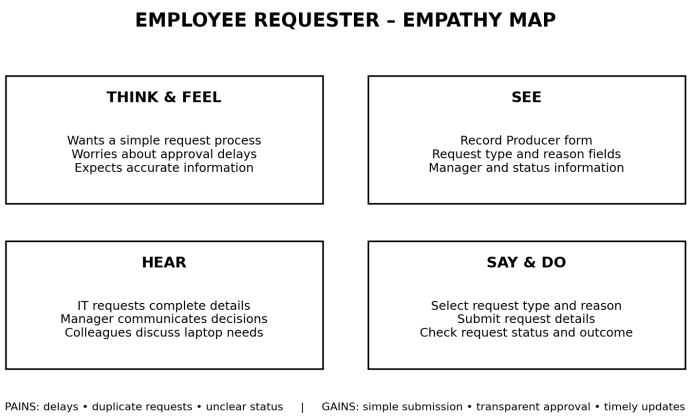

Figure 1. Empathy map for the employee requester.

6. Selected Solution Direction

The selected direction is to use a ServiceNow Record Producer connected to a custom Laptop Request Form table. A before-insert Business Rule checks for an existing request by the same requester in the current calendar year. Flow Designer sets the request to Pending Approval, asks the referenced manager for a decision, updates the outcome and triggers notifications. Roles and ACLs control access.

Note: Project mode: Individual project. Team ID and team-member fields from the source templates have been removed. The original project date, 12 September 2026, has been retained.
