Employee Laptop Request Management System

Testing Phase

Project Name	Employee Laptop Request Management System
Project Type	Individual Project
Document Date	12 September 2026
Platform	ServiceNow

1. Testing Objective

Testing verifies that the Employee Laptop Request Management System captures valid requests, enforces the annual duplicate policy, routes manager approval, updates status, sends notifications and restricts access according to roles and ACLs.

2. Test Environment

Item	Environment / value
Platform	ServiceNow instance (instance URL and release not included in supplied ZIP).
Application	Employee Laptop Request Management System.
Primary table	Laptop Request Form custom table; exact technical name to be confirmed in the instance.
Test roles	it_employee, it_manager and administrator.
Test data	Use controlled test users and request records; do not use real employee personal data in screenshots.

3. Functional Test Cases

Test ID	Scenario / action	Expected result	Evidence status
TC-01	Submit a valid laptop request.	A request record is created with mapped fields.	Reported Pass in source; screenshot/log not supplied.
TC-02	Submit another request for the same requester in the same calendar year.	The second insert is blocked with a clear message.	Reported Pass in source; screenshot/log not supplied.
TC-03	Submit a request for a different requester.	The valid request is accepted.	To be revalidated in live instance.
TC-04	Submit a request with a missing required field.	Submission is prevented or validation is shown.	To be revalidated in live instance.
TC-05	Route request to referenced manager.	Approval is created for the intended manager.	Reported Pass in source; screenshot/log not supplied.
TC-06	Manager approves request.	Status changes to Approved.	Reported Pass in source; screenshot/log not supplied.
TC-07	Manager rejects request.	Status changes to Rejected.	Reported Pass in source; screenshot/log not supplied.
TC-08	Complete approval decision.	Appropriate email notification is generated.	Reported Pass in source; screenshot/log not supplied.
TC-09	Employee attempts permitted create/read/write operations.	Access follows it_employee ACL configuration.	Reported Pass in source; screenshot/log not supplied.
TC-10	Manager attempts create/write and reads request.	Read is allowed; create/write are restricted by design.	Reported Pass in source; screenshot/log not supplied.
TC-11	Review approval record relationship.	Approval record is associated with the correct request.	To be revalidated in live instance.
TC-12	Review update-set contents.	Only intended project changes are captured.	Blocked pending corrected update-set export.

4. Security Test Matrix

Test role	Action	Expected result
it_employee	Create a request	Allowed when required fields and policy checks pass.
it_employee	Read permitted request records	Allowed according to ACL conditions.
it_employee	Write permitted request records	Allowed only for fields/records permitted by ACLs.
it_manager	View request records	Allowed.
it_manager	Create or modify request records	Restricted by the stated design.
Administrator	Review configuration and update sets	Allowed subject to platform privileges.

5. End-to-End Test Procedure

Step	Action	Expected outcome
1	Open the Laptop Request Record Producer.	Form is available to the employee.
2	Enter requester, email, manager and request details.	Form fields contain valid information.
3	Submit the request.	Request record is created.
4	Run duplicate validation.	Duplicate within the current year is blocked.
5	Start approval flow.	Manager receives an approval request.
6	Approve or reject as manager.	Decision is recorded.
7	Check request status.	Status reflects the decision.
8	Check notification.	Requester receives the configured outcome email.
9	Test role-based access.	Employee and manager permissions match ACL design.
10	Review deployment package.	Correct project components are captured.

6. Defect and Retest Log

ID	Finding	Severity	Action / retest
D-01	The supplied update-set XML is named HR onboarding application, uses Global as the update-set application, and contains one sys_app DELETE action.	High	Do not use as the final project deployment package. Create and export a correct project update set; preview and verify it.
D-02	No live ServiceNow implementation screenshots or execution logs are included in the ZIP.	Medium	Capture genuine evidence for form, table, rule, flow, approvals, ACLs and notifications.
D-03	No signed UAT approval evidence is included.	Medium	Complete UAT with an authorized reviewer if required and attach actual sign-off.

7. Testing Conclusion

The original project documents describe the core test scenarios and mark several as passed. The supplied ZIP does not include enough independent execution evidence to verify those results. The project should be considered functionally documented, with live-instance evidence and update-set correction remaining before final acceptance.

> Note: Do not mark a test as independently passed until it has been executed in the target ServiceNow instance and supported by an actual result or screenshot.
