

01 Project Documentation

Employee Laptop Request Management System

Date	12 September 2026
Team ID	
Project Name	Employee Laptop Request Management System
Maximum Marks	Documentation

Project Overview

This project implements a structured Employee Laptop Request Management System in ServiceNow. It covers laptop request submission, request information capture, Basic/Advance classification, annual duplicate prevention, manager approval, status management, email notifications, role-based access and controlled deployment.

Purpose

The documentation provides a consistent reference for the implemented solution, its functional flow, roles, approval relationship, validation activities and deployment-readiness considerations.

Scope

- Employee laptop request submission through a ServiceNow Record Producer.
- Laptop Request Form table and configured request fields.
- Basic / Advance request classification and reason capture.
- One-request-per-employee-per-year validation.
- Manager approval through Flow Designer and sysapproval_approver.
- Approved / Rejected status handling and email notifications.
- IT employee and IT manager roles, groups and ACLs.
- Update Set based deployment and configuration handover.

Users and Roles

- IT Employee — creates, reads and writes permitted laptop request records.
- IT Manager — views request records and acts as the approval stakeholder.
- Project Team — configures, validates and prepares the application for deployment.

01 Project Documentation

Employee Laptop Request Management System

Date	12 September 2026

Project Name	Employee Laptop Request Management System
Maximum Marks	Documentation

Expected Benefits

- Standardized laptop request process.
- Reduced manual email and verbal request handling.
- Prevention of duplicate requests within a calendar year.
- Clear manager approval and request status.
- Better access control and accountability.
- Traceable request and approval records.
- Controlled deployment through update sets.

Documentation Status

The project documentation describes the configured ServiceNow solution and its validation approach. Screenshots or instance-specific execution evidence can be attached to the final submission where required.

02 Functional Design Document

Employee Laptop Request Management System

Date	12 September 2026
Team ID	
Project Name	Employee Laptop Request Management System
Maximum Marks	Documentation

Functional Flow

Employee opens Record Producer → Enters request details → Requester email is populated → Request is inserted → Business Rule checks annual duplicate → Flow sets Pending Approval → Manager approves/rejects → Status becomes Approved/Rejected → Email notification is sent.

Request Information

Field	Purpose
Number	Auto-generated unique request number.
Requester	Employee submitting the request.
Employee Email	Requester contact email populated from the selected user.
Request Date	Date/time associated with request creation.
Short Description	Brief summary of the laptop requirement.
Manager	Manager responsible for approval.
Type of Laptop / Request	Basic or Advance.
Status	Pending Approval, Approved or Rejected.
Reason	Software Development, Personal Use or Other.

Lifecycle Requirements

- The request should contain sufficient information for processing and approval.
- Duplicate requests by the same employee within the current year must be blocked.
- Manager approval must be connected to the request.
- Status must reflect the approval outcome.
- Employees and managers must receive the appropriate notifications.
- Access must follow the configured roles and ACLs.

03 User Guide

Employee Laptop Request Management System

Date	12 September 2026

Project Name	Employee Laptop Request Management System
Maximum Marks	Documentation

IT Employee / Requester

- Open the ServiceNow Service Portal and select the Laptop Request Record Producer.
- Select the requester and verify the employee email.
- Enter short description, manager, Basic/Advance type and reason.
- Submit the request.
- If an existing request for the same employee is found in the current calendar year, the system blocks the new request.
- Track the request status as Pending Approval, Approved or Rejected.

IT Manager

- Review the submitted laptop request.
- Use the approval record to approve or reject the request.
- Approved requests move to Approved status; rejected requests move to Rejected status.
- The requester receives the outcome notification.

Project / Administrator

- Maintain roles, groups and ACLs.
- Review Business Rule and Flow Designer configuration.
- Validate update-set capture before deployment.
- Preview and commit the update set in the target instance.

Important Note: Exact navigation labels and UI behaviour depend on the final ServiceNow instance configuration.

04 Testing and Deployment Validation

Employee Laptop Request Management System

Date	12 September 2026

Project Name	Employee Laptop Request Management System
Maximum Marks	Documentation

Functional Validation

- Validate Record Producer submission and field mapping.
- Validate requester email population.
- Validate Basic / Advance and reason choice values.
- Validate annual duplicate-request prevention.
- Validate manager approval relationship and Flow Designer outcome.
- Validate Pending Approval, Approved and Rejected status behaviour.
- Validate email notifications.
- Validate IT employee and IT manager roles, groups and ACLs.
- Validate update-set capture and deployment readiness.

End-to-End Test Scenario

Create a laptop request → populate requester and request information → submit → check duplicate policy → start manager approval → approve/reject → update status → send outcome notification → verify role-based access and update-set capture.

Deployment Readiness

- Custom application, table, fields and Record Producer captured.
- Business Rule, Flow Designer, approval relationship and notifications captured.
- Roles, groups and ACLs captured.
- Update Set preview/commit process prepared.
- Target instance validation to be performed after deployment.

Status: The source project materials describe the implementation and validation design; no unsupported external production results are asserted.
